ArtDrop

Setup Guide

Install ArtDrop and connect your art accounts

ArtDrop posts your art to many sites at once. You drop in an image, it writes a caption for each site, and one click sends it to Bluesky, Telegram, Discord, Tumblr, DeviantArt, Instagram and Pixiv. This guide takes you from download to your first test post. Each site is set up once; after that you never repeat these steps.

Open-source project. Works on Windows 10 and 11. Everything runs on your own PC.

1. What you need

Item	Details
A Windows PC	Windows 10 or 11. ArtDrop runs on your own computer; there is no cloud server and no subscription.
Python 3.11 or newer	Free from python.org. During install, tick **Add Python to PATH** and keep the **py launcher** option on.
Google Chrome	Only needed for Pixiv (ArtDrop fills Pixiv's upload form in a real browser window). Microsoft Edge works as a fallback.
Your art accounts	Only the sites you want. Every site is optional.
Caption AI (optional)	An OpenCode Go subscription, if you want the AI to look at your art and write captions and tags. ArtDrop works without it.
Disk space	About 1 GB for ArtDrop, its Python packages and the browser component.

> **Note:** ArtDrop only listens on your own PC (address 127.0.0.1). Your logins are stored in **Windows Credential Manager**, never in a plain file, and they are never shown back on the page. Nothing leaves your PC except the posts themselves.

2. Install and start

1. Download ArtDrop from its GitHub page: **Code** → **Download ZIP**, or clone it with `git clone`.
2. Extract it to a simple folder, for example `C:\ArtDrop`.
3. Double-click `Start ArtDrop.bat`. The first start takes a few minutes: it creates a private Python environment and downloads what ArtDrop needs, including a browser component for Pixiv (about 150 MB). This happens only once.
4. Your browser opens `http://127.0.0.1:8765/`. That page is ArtDrop.
5. **Keep the black console window open** while you use ArtDrop. Closing it stops the app.

> **Tip:** If Windows asks whether to let Python through the firewall, you can press Cancel. ArtDrop does not accept connections from other computers.

> **Tip:** When you download a newer ArtDrop later, start it with the same .bat file. It notices new requirements and prints *Updating ArtDrop's components...* before starting. Keep your old `data` folder (copy it into the new version) to keep your queue, history and Pixiv logins.

3. Connect your sites

Open the **Accounts** tab. Every site has a card with **Save**, **Test connection** and **Remove**. Set up only the sites you use. After each one, press **Test connection**: a green message means it works.

Bluesky (about 2 minutes)

1. In Bluesky, open **Settings** → **Privacy and security** → **App passwords** → **Add App Password**. Name it ArtDrop and leave direct-message access off.

2. Copy the password it shows (it looks like xxxx-xxxx-xxxx-xxxx). It is shown once.
3. In ArtDrop, Bluesky card: enter your **handle** (yourname.bsky.social, without @) and the **app password**. Save, then Test connection.

> **Important:** Never enter your real Bluesky password. An app password can be revoked any time.

Telegram (about 3 minutes)

1. In Telegram, message **@BotFather** (blue checkmark), send /newbot and follow the steps. The username must end in *bot*.
2. BotFather sends a **token** (123456789:AA...). Tap it to copy the whole token.
3. Open your channel → **Manage channel** → **Administrators** → **Add admin**, add your bot and keep **Post messages** on.
4. In ArtDrop, Telegram card: paste the **bot token**. As **chat id**, enter your channel's @username for a public channel. For a private channel, use its numeric id (it starts with -100).

> **Tip:** "Unauthorized" on Test connection means the token was copied incompletely or was replaced. In BotFather send /mybots, pick your bot, tap API Token and copy it again.

Discord (about 1 minute)

1. In Discord, right-click your art channel → **Edit Channel** → **Integrations** → **Webhooks** → **New Webhook** → **Copy Webhook URL**.
2. In ArtDrop, Discord card: paste the webhook URL. Save, then Test connection.

> **Important:** Treat the webhook URL like a password: anyone who has it can post in that channel. If it leaks, delete the webhook in Discord and make a new one.

Tumblr (about 5 minutes)

1. Open `tumblr.com/oauth/apps` → **Register application**. Any name, description and website (for example `https://example.com`).
2. In both **Default callback URL** and **OAuth2 redirect URLs** enter exactly `http://localhost:8765/oauth/tumblr`. Tumblr refuses the address 127.0.0.1, so use the word localhost.
3. Register, then copy the app's **OAuth Consumer Key** (client ID) and **Secret**.
4. In ArtDrop, Tumblr card: your **blog** (yourname.tumblr.com), the client ID, the client secret, and as **Redirect URI** the same `http://localhost:8765/oauth/tumblr`. Save.
5. Press **Connect** → **Allow**. The page says *connected*. Then Test connection.

DeviantArt (about 5 minutes)

1. Open `deviantart.com/developers/apps` → **Register Application**.
2. **OAuth2 Redirect URI Whitelist:** `https://127.0.0.1/artdrop`. DeviantArt only accepts https addresses.

3. **Client type:** Confidential. Leave the other fields empty, accept the terms and save. Copy the **client_id** and **client_secret**.
4. In ArtDrop, DeviantArt card: the client ID and secret, and as **Redirect URI** `https://127.0.0.1/artdrop`. Save.
5. Press **Connect** → **Authorize**. Your browser then shows *This site can't be reached*. **That is expected.**
6. Right away, copy the **whole address** from the address bar, paste it into the code box on the DeviantArt card and press **Finish connection**.

> **Tip:** DeviantArt login codes work once and expire within minutes. If you see "Incorrect authorization code", press Connect again and paste the newest address.

Instagram (about 20 to 30 minutes, once)

Instagram needs a **Professional** account (Creator or Business). Switching is free in the Instagram app under **Settings** → **Account type and tools**. No Facebook Page is needed and your Instagram does not have to be linked to Facebook.

1. Go to `developers.facebook.com` and log in with any Facebook account. It only owns the developer app. Nothing is ever posted to Facebook.
2. **My Apps** → **Create App**. Choose the use case **Manage messaging & content on Instagram**, and *I don't want to connect a business portfolio yet*.
3. Open **Customize** → **Permissions and features** and add only `instagram_business_basic` and `instagram_business_content_publish`. Skip the "Add all required permissions" button (those are messaging permissions).
4. Open **API setup with Instagram login** → **Generate access tokens** → **Add account** and log in as the Instagram account you want to post from. Use a private browser window for each extra account, so the right one is used.
5. In **Set up Instagram business login** → **Business login settings**, add the redirect URI `https://localhost/artdrop` **with no slash at the end**, and save.
6. Copy the **Instagram app ID** and **Instagram app secret** from the API setup page (not the Meta app ID at the top).
7. Get a free image-host key: sign in at `api.imgbb.com` and press **Get API key**. Instagram fetches pictures from a public link, so ArtDrop parks each image there for one hour.
8. In ArtDrop, Instagram card: app ID, app secret, Redirect URI `https://localhost/artdrop` and the imgbb key. Save.
9. Press **Connect** → **Allow**. On the *can't be reached* page, copy the whole address, paste it into the code box and press **Finish connection**.

> **Important:** Do not use the "Instagram Tester" role under App roles. It belongs to a retired API and its form will not save. Accounts are added with **Add account** as above. Accounts with an active Instagram restriction may be refused until the restriction ends.

More than one Instagram account: add each one to the Meta app (step 4), then press **Add Instagram account** in ArtDrop, give it a name (for example Solo or Collab) and connect it. On an account that

should invite collaborators, tick **Can send collab invites** and enter up to three usernames. The invited account accepts the invite in the Instagram app.

ArtDrop renews Instagram's login by itself every 60 days.

Pixiv (about 5 minutes per account)

Pixiv has no official posting API. ArtDrop fills Pixiv's normal upload form in a real Chrome window and **you press Post yourself**. ArtDrop never sees your Pixiv password.

1. Accounts tab → **Add Pixiv account**, give it a name, press **Log in**.
2. A normal Chrome window opens on Pixiv's login page. Sign in, including any CAPTCHA or two-factor code.
3. When you see your Pixiv home page, **close that Chrome window**.
4. Press **Check login**. It says *Logged in to Pixiv*.
5. For a second account, repeat with **Add Pixiv account**.

> **Tip:** If you normally log in to Pixiv with Google, Google may block the sign-in in this window. Set a Pixiv password first (pixiv.net → Settings → Account → Password) and sign in with email and password.

> **Note:** Pixiv's automation is unofficial. ArtDrop keeps it safe by stopping before Submit, always marking works as AI-generated, and never posting to Pixiv in bulk. Pixiv could still change its page; ArtDrop then tells you which field to fill by hand.

Caption AI (optional)

1. Sign in at `opencode.ai`, open the Console and create an **API key** for your Go subscription.
2. In ArtDrop, open **Accounts** → **Caption AI**, paste the key and Save. Leave the model boxes as they are.
3. Press **Test connection**. It checks that both models can really see images, for example: *Caption AI ready - vision deepseek-v4.1-flash, backup mimo-v2.6-flash*.

> **Tip:** AI models get retired now and then. If Test connection says *model not available (retired or renamed)*, enter another image-capable model from the OpenCode Go list (for example mimo-v2.6-flash or glm-5.3-flash). No code change is needed.

Not supported yet

X / Twitter (its API is pay-per-post) and **Reddit** (new API apps need approval, and new accounts are filtered by most art subreddits). Both can be added later.

4. Your first test post

1. Open the **Post** tab and drop in one finished piece.
2. Tick the sites you connected. On Tumblr you can tick **Post as a draft**, and on DeviantArt **Save to Sta.sh only**, for a private first test.
3. Tick **Dry run** and press **Post**. Each card shows exactly what would be sent. Nothing is posted.
4. Untick Dry run and press **Post**. Each card turns to *posted* with a link.

From here, the **User Guide** explains everything else: captions, Pixiv, Instagram collabs and the automatic folder (lazy) mode.

5. Troubleshooting

Problem	What to do
The page says it can't be reached	Check that the black console window is still open, then refresh the page.
"Address already in use"	ArtDrop is already running. Just open http://127.0.0.1:8765/.
"Not set up yet - missing: ..."	Open Accounts, fill in the named fields, Save.
Bluesky login failed	Use an app password, not your account password.
Telegram getChat failed	The bot is not an admin of the channel, or the chat id is wrong.
"Invalid redirect_uri" (Instagram)	The Redirect URI in ArtDrop and in Meta's Business login settings must match exactly: https://localhost/artdrop with no slash.
"This url's domain is not valid" (Tumblr)	Use localhost instead of 127.0.0.1.
Pixiv keeps showing "Verify you are human"	That window is automated. Use **Log in** on the Pixiv card, which opens a normal Chrome.
Pixiv says a Chrome window still has the account open	Close the Pixiv Chrome window, then press the button again.
The page looks outdated after an update	Press Ctrl+F5 to reload it.
Something else	Look in `data\artdrop.log`. It records what happened without ever writing your passwords or tokens.
