ArtDrop

User Guide

Post once, reach every site

This guide shows how to use ArtDrop day to day: posting a piece by hand, letting the AI write captions for every site, posting to Pixiv and Instagram, and the lazy mode that posts from a folder by itself. It assumes your sites are already connected (see the Setup Guide).

Open-source project. Works on Windows 10 and 11. Everything runs on your own PC.

1. The four tabs

Tab	What it is for
Post	Post a piece by hand: images, character, captions, sites, then Post.
Queue	Lazy mode: the folder settings, the upcoming posts, and the **Needs you** list.
Accounts	Connect and test your sites and the Caption AI.
History	Every post and every attempt, with a link to each real post.

2. Posting a piece

1. **New post** clears the page. Drop in your images; the first image is the cover. You can also drop a .txt file with the caption, and a line starting with `tags:` for tags.
2. Type the **character** (and the **series** if you like). Tick **Mature** for suggestive pieces.
3. Tick the sites to post to. Each site has its own card.
4. Press **Generate**. The AI looks at the cover image and writes a caption, tags and alt text for each ticked site, in that site's style.
5. Read and edit anything. Everything stays editable, and nothing posts by itself.
6. Optional: tick **Dry run** and press Post to preview. Then untick it.
7. Press **Post**. Each card shows its own result and a link.

If one site fails, the others still go out. A failed card gets a **Retry** button. A card that shows *posted* is locked, and pressing Post again only sends to sites that don't have the post yet. So nothing is posted twice by accident.

> **Tip:** If you type your own caption before pressing Generate, the AI **polishes** it for each site and keeps your meaning. Tick **Use my caption as-is** to post your words exactly.

Caption styles

Every site card has a **Caption style** menu:

Style	What gets posted
AI caption	The caption and tags written for that site (or your own).
Name + series	Only the character and series, for example: Stelle - Honkai: Star Rail. No description and no tags. The default for Telegram.
Images only	No text at all.

What the AI writes for each site

Site	Caption	Tags
Bluesky	one or two short lines, 300 characters in total	3 to 5
Telegram	2 to 4 warmer lines (or Name + series)	6 to 10
Discord	one casual line	0 to 3
Tumblr	1 to 3 lines	5 to 15, in Tumblr's tag field
DeviantArt	a short title and a 2 to 4 line description	up to 30
Instagram	1 to 3 friendly lines	10 to 15 hashtags
Pixiv	a Japanese title and caption	up to 10, in Japanese, with the series and official character name first

The AI never mentions AI, prompts or tools in captions. Sites that require an AI label get it through their own setting instead (DeviantArt's *Created using AI tools*, Pixiv's *AI-generated work*). A small #aiart tag is added by default; you can switch it off in **Accounts** → **Caption AI**.

Images per site

If you post more images than a site allows, ArtDrop sends the first ones and says so on the card, for example *posted the first 4 of 10 images*. Put your best image first.

Site	Images per post	Notes
Bluesky	4	shrunk to about 1 MB each
Telegram, Discord, Tumblr	10	
DeviantArt	1	the full-size original is sent
Instagram	10 (carousel)	tall art is fitted to 4:5 with white bars at the sides
Pixiv	many	originals up to 32 MB; WEBP becomes PNG

3. Site notes

DeviantArt

- Mature pieces are marked mature with the level you choose (moderate or strict).
- Every deviation is labelled *Created using AI tools* and *NoAI* (not for AI training), as DeviantArt's rules require.
- The title comes from the AI (for example *Stelle at the Summer Festival*). You can type your own on the card.

Tumblr

- Tumblr's API can't set the *Mature* community label. For suggestive pieces, set it in the Tumblr app after posting; ArtDrop reminds you.

Instagram

- Instagram is much stricter than the other sites about suggestive art. Post your safer pieces there.
- On an account with collab invites on, the card shows *Will invite: @name* under the Collaborators box. Clear the box to post without a collaborator this time.

- The invited account must accept the invite in the Instagram app. Then the post shows on both profiles.

Pixiv (semi-automatic)

1. Tick one or more Pixiv accounts and pick the **rating** on each card: All ages, R-18 or R-18G. ArtDrop never picks the rating for you.
2. Press Post. A Chrome window opens and fills in the images, Japanese title, caption, tags, the rating and *AI-generated work: Yes*. Then it stops.
3. Check the form. Fix anything you like directly in the window.
4. Press **Post** in the Pixiv window yourself. ArtDrop saves the artwork link, and the next account's window opens.

> **Tip:** Leave *Original work* unticked for fan art. Tick it yourself in the Pixiv window only for your own original characters.

Japanese example of a title the AI may write: 推しはどの子？ ("Which one is your favourite?")

4. Lazy mode: post from a folder

Lazy mode posts by itself. You drop images into a folder, and ArtDrop captions them and posts them over time, spaced out so your feed looks natural.

Turning it on

1. Open the **Queue** tab and tick **Post from my outbox folders automatically**, then Save. A banner shows while lazy mode is on, with a **Pause** button.
2. Check which sites each folder feeds (the tick boxes under each folder).

Folder	Posts to	Mature
`Pictures\ArtDrop\outbox`	Bluesky, Telegram, Discord, Tumblr, DeviantArt	yes, by default
`Pictures\ArtDrop\outbox-instagram`	the same sites plus Instagram	no

> **Important:** Lazy mode really posts in public without asking you. Only put pieces in these folders that you are happy to have posted as they are.

How images become posts: one subfolder = one post

The simplest and most reliable way is to use **subfolders** and put nothing loose in the outbox. The folder name tells ArtDrop what the post is, so the AI never has to guess who the character is. It only writes the captions.

You want	Do this	Result
One character	`outbox\Changli\` with the images	one post about **Changli**. The AI adds the game if it knows it.
The same character again	`outbox\Changli (2)\`	another Changli post. A counter like (2), _2 or -2 is ignored.
Several characters in one post	`outbox\mix\` or `mix-morning`	one post with a catchy universal caption such as *Good morning! Which one is your fav? Comment below!*
Your own caption	a `caption.txt` inside the subfolder	the AI polishes your words for each site. First line `!exact` = use them word for word.
A reminder folder	a name starting with _	never posted (for example the empty _EXAMPLE Character Name folder).

```
Pictures\ArtDrop\
    outbox\                        mature pieces
        Changli\       1.png 2.png          -> one post: Changli
        Changli (2)\   3.png                -> another Changli post
        mix-morning\   a.png b.png c.png    -> one universal post
                       caption.txt  "good morning, which one is your fav?"
    outbox-instagram\              safe pieces (also go to Instagram)
        Jane Doe\      1.png
    posted\2026-10-01\Changli\     <- finished sets end up here, with their links
```

Loose images (dropped directly into an outbox folder) also work: characters the AI recognises become one post each, and images it doesn't recognise are posted together as one **universal** post with a catchy caption.

> **Tip:** A name that really ends in a number stays intact: *Android 18* is posted as Android 18. Use a counter in brackets, like *Changli (2)*, for repeat posts.

The schedule

Every site has its own queue. Sites that take many images get bundles; sites that take few get one post at a time. The defaults (changeable under **Per-site images and spacing**, never below 30 minutes):

Site	Images per post	Time between posts
Telegram, Discord, Tumblr, Instagram	up to 10	2 hours
Bluesky	4	2 hours
DeviantArt	1	2 hours

Example: a set of 20 images becomes 2 posts of 10 on Telegram, 5 posts of 4 on Bluesky and 20 posts on DeviantArt, each site spaced 2 hours apart. Optional **quiet hours** hold posts during the night.

> **Note:** Posts go out only while ArtDrop is open and the PC is awake. If the PC was off, nothing is lost: overdue posts continue one at a time with the normal spacing, never all at once. To keep posting while you're away, leave ArtDrop running and set Windows sleep to a longer time.

Needs you

- **Pixiv** waits here for every set, because you pick the rating and press Post. One click opens the Post tab with the Japanese text filled in. If you don't want a set on Pixiv, press **Dismiss**. To skip Pixiv for a whole folder, untick **Also prepare for Pixiv** in that folder's settings.
- If the AI service is down, ArtDrop retries a few times by itself. Only then does the set land here, with a **Retry AI** button.
- A queued set with the wrong text can be pulled back with **Wrong? Move to Needs you**.

Queue controls

Post now, **Edit caption**, **Skip**, **Retry**, **Remove** and **Pause lazy mode**. A **Stuck** list shows files ArtDrop can't post (such as a PSD or a ZIP).

After posting

Images stay in the outbox until the **last** post of their set has gone out (and the Pixiv entry is posted or dismissed). Then the whole set moves to `Pictures\ArtDrop\posted\<date>\<folder name>` with a small file of all its post links, and the emptied folder is removed from the outbox.

> **Tip:** Each image is posted at most once per site. ArtDrop recognises images by their content, so renaming a file does not post it again, and a new image with an old file name is still picked up.

5. History

The History tab lists every attempt: time, site, result, a link to the post, and the error if something failed. Dry runs are listed too, marked as such.

6. Good habits

- Mark suggestive pieces as **Mature**, and pick the right Pixiv rating. Wrong ratings can get accounts restricted.
- Respect each site's rules on AI art. ArtDrop sets the AI labels, but communities and groups may have their own rules.
- Keep your keys and webhook links private. If one leaks, revoke it on the site and enter a new one in Accounts.
- Use Dry run whenever you change something big.
